

Davit Testing

For instances when only the lifeboat davit requires to be load tested, specially designed bags are used for suspended loads on the davits. Every five years, davits require proof load testing to 1.1 times the total mass of the lifeboat.

Water Weights bags are type tested and certified with a physically proven factor of safety in excess of 6:1.

The load is always measured with a certified load cell allowing for accuracy of +/- 1% of the load with a remote readout for convenience.

Water Weights, with its comprehensive network of operators and associates worldwide, can assist with your davit testing requirements. Our safe and certified product range makes Water Weights equipment 'the way' of safely performing lifeboat and davit testing.
